Variables needed by the EMEP model

From the EMEP rv4.3 user guide

Table 2.2: Input meteorological data used in the EMEP/MSC-W Model

Parameter	Unit	Description
3D fields - for 20 σ levels		
u, v	m/s	Horizontal wind velocity components
q	kg/kg	Specific humidity
θ	K	Potential temperature
CW	kg/kg	Cloud water
CL	%	3D Cloud cover
$cnvuf$	kg/sm ²	Convective updraft flux
$cnvdf$	kg/sm ²	Convective downdraft flux
PR	mm	Precipitation
2D fields - for Surface		
PS	hPa	Surface pressure
$T2$	K	Temperature at 2m height
$Rh2$	%	Relative humidity at 2m height
SH	W/m ²	Surface flux of sensible heat
LH	W/m ²	Surface flux of latent heat
τ	N/m ²	Surface stress
SST	K	Sea surface temperature
SWC	m ³ /m ³	Soil water content
$lspr$	m	Large scale precipitation
cpr	m	Convective precipitation
$sdepth$	m	Snow depth
ice	%	Fraction of ice
$SMI1$		Soil moisture index level 1
$SMI3$		Soil moisture index level 3
$u10/v10$	m/s	wind at 10 m height

How to setup a WRF domain for EMEP

WRF setup to match the EMEP model domain

A 4 steps procedure to setup a new WRF domain:

Setting the domain and sub-domain GRID setup

```
&geogrid
parent_id      = 1,1,2,3,3,
parent_grid_ratio = 1,5,2,5,5,
i_parent_start = 1,65,25,40,210,
j_parent_start = 1,40,15,130,105,
e_we          = 171,171,271,321,261,
e_sn          = 134,161,271,371,371,
dx = 50000,
dy = 50000,
map_proj = 'polar',
ref_lat = 57,
ref_lon = 6,
truelat1 = 60,
truelat2 = 90,
stand_lon = -32,
/
```

1. Define a model coarse domain and any nested domains – geogrid.exe
 2. Extract meteorological fields from GRIB data sets (NCEP or ECMWF) – ungrib.exe
 3. Horizontally interpolate meteorological fields to the model domains – metgrid.exe
 4. Vertically interpolate the meteorological fields and if required setting the data for nudging – real.exe
- ...Running the WRF model... - wrf.exe

August 2008 – Scotland and Netherlands

How good are the main met variables?

- Temperature seems to be ok
- Wind speed and direction ok-ish
- Precipitation timing ok but problem with magnitude - also some issues on fine domain

Temperature vs. UK AWS MIDAS

Example of 2001 3-hourly WRF calculated surface temperature for Bedford

2m Temperature bias for all sites...

Model-observations annual average bias

2001

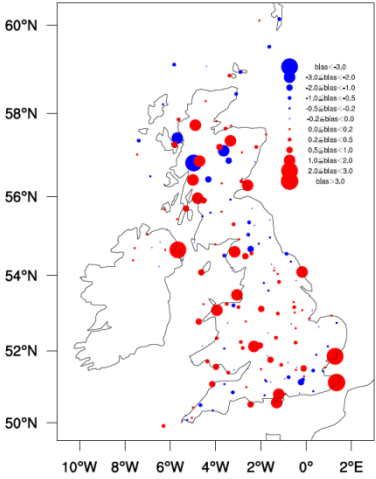

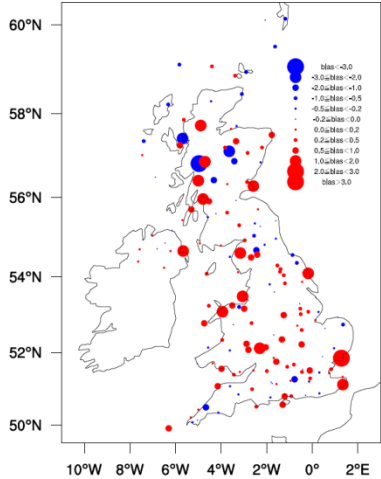

2002

2009

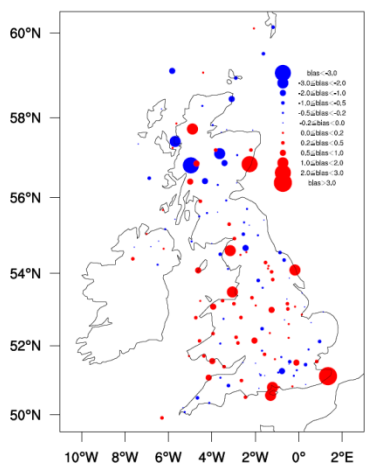

WMO-SYNOP Stations vs WRF model: bias

WMO-SYNOP Stations vs WRF model: bias

WMO-SYNOP Stations vs WRF model: bias

.....

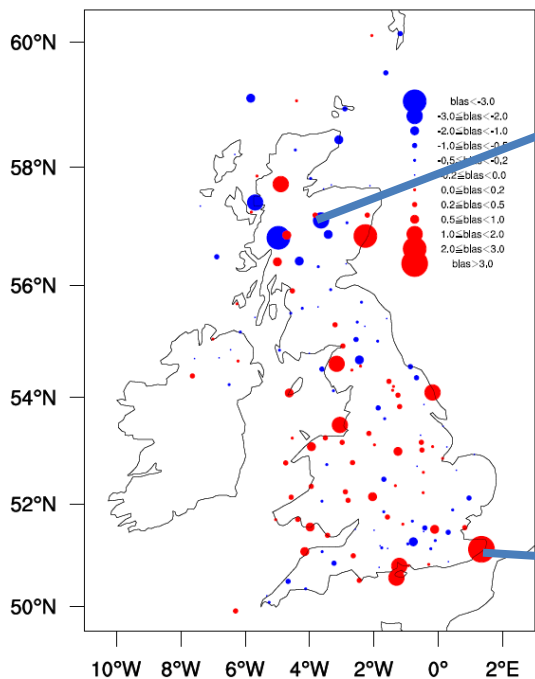

Some sites are consistently underestimate or overestimate 2m temperature

Temperature : WRF 3.1 – 2009

~200 sites across the UK

WMO-SYNOP Stations vs WRF model: bias

Site height ~1200 m
WRF 5 km² grid ~500 m

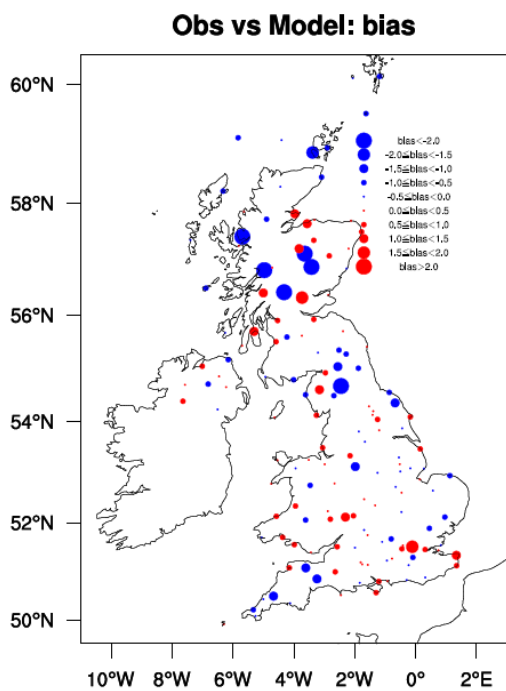

WRF calculate 2m T as if was sea!

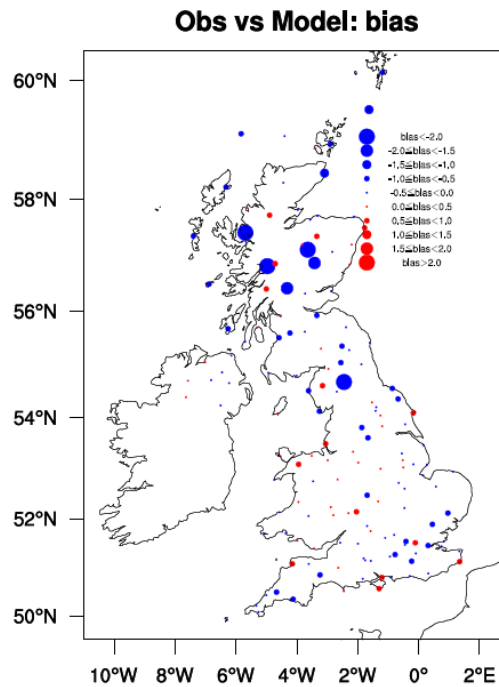

Does high res help with elevated sites?

- WRF 3-hourly Meteorology
 - 2 months of computing time 80 processors
- Meteorology – UK analysis (MIDAS 190 UK sites)

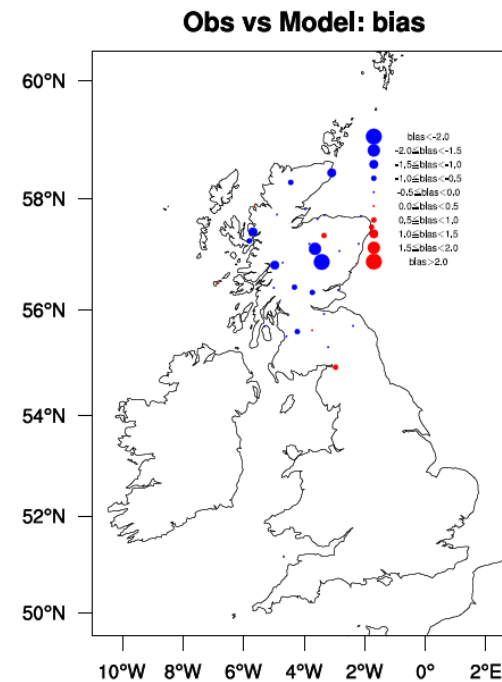

50 km² Europe

5 km² UK

1 km² Scotland

Way to improves....higher resolution CAIRNGORM SUMMIT 1245 m

50 km² grid

1 km² grid

Grid size	Model WRF	Obs MIDAS	Bias	Slope	R ²
50 km ²	6	0.9	-5.1	0.91	0.8
5 km ²	3.5	0.9	-2.6	0.94	0.9
1 km ²	2.8	0.9	-1.9	0.95	0.9

Wind speed - direction

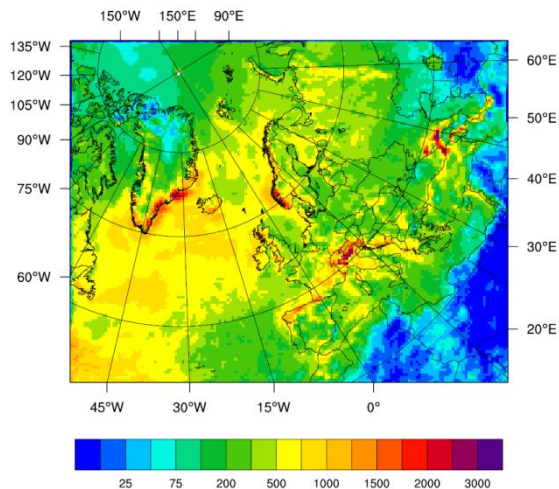

Fig. 2. Time series of hourly modelled (red, black) and observed (blue, pale blue) 10 m wind speed (bottom, m s^{-1}) and 10 m wind direction (top, degrees) at Wattisham.

Rainfall pattern

50 km²

1 km²

With a parent ratio of 5 the edge of the domain may have side effects

It is probably better to use a parent ratio of 3

Also the average total rainfall for the UK is ½ the UK met office rainfall map

10 km²

5 km²

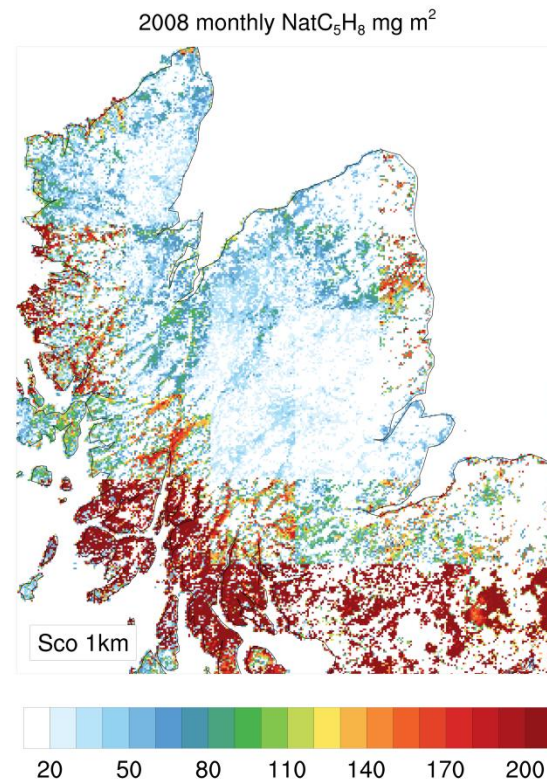

1 km²

Non standard EMEP domain setup

- Creating the emissions for the relevant scale (<5 km²)
- Re-projection of natural emissions (i.e. DMS)
- Default land cover (.nc) not fine enough for <5 km² domain – I use WRF-MODIS instead
 - Perhaps WRF MODIS derived land cover should always be use in EMEP-WRF

Emissions example

Model validation specific to the UK

ABERDEEN urban 2008 (57.15736,-2.094278)

AURN vs. EMEP4UK
>90 sites across the
UK for hourly ozone,
NO_x, SO₂, PM_{2.5}

Not all site measure
everything
